

Improving **Shared** Decision Making on the Neonatal Unit through **Assessment** of **Parental** Experiences: *The ShAPE Study*

The purpose of this study is to better understand shared decision making in neonatal care so we can develop an evidence-based information tool to support families. Participants will be invited to an interview to discuss their experience of clinical discussions about their babies care whilst on the neonatal unit.

In order to participate, you must have had a baby who has been discharged from hospital and , within the last 6 months, received one of the following treatments whilst on a neonatal unit;

1. ***Steroid Therapy for Chronic Lung Disease***
2. ***Medication for Persistent Ductus Arteriosus (PDA)***
3. ***Transfusion of Blood Products.***

If you are interested in participation or would like to learn more, please email the chief investigators.
